Information Display and Household Behavior

December 16, 2016 1 / 41

### Research Question

 Previous research suggests that individuals' decisions are influenced by the way in which information is presented to them (Kahneman, 1973; Benartzi and Thaler, 1999; Hirshleifer and Teoh, 2003; Bordalo, Gennaioli and Shleifer, 2012)

### Research Question

- Previous research suggests that individuals' decisions are influenced by the way in which information is presented to them (Kahneman, 1973; Benartzi and Thaler, 1999; Hirshleifer and Teoh, 2003; Bordalo, Gennaioli and Shleifer, 2012)
- But we face many open questions:
  - How do households react to information display outside of controlled settings?
  - Does this matter for important decisions like retirement savings allocations?
  - What are possible implications for public policy? Disclosure requirements?

### Why Would HH React to the Way Info is Displayed?

- Individuals have limits on the amount of information they can attend to and process (Kahneman, 1973)
  - How individuals react in given situation will partially be determined by where their attention is directed
  - Information that is prominently displayed or exciting is salient

### Why Would HH React to the Way Info is Displayed?

- Individuals have limits on the amount of information they can attend to and process (Kahneman, 1973)
  - How individuals react in given situation will partially be determined by where their attention is directed
  - Information that is prominently displayed or exciting is salient
- $\Rightarrow$  Info salience  $\rightarrow$  Where attention is directed  $\rightarrow$  HH decisions

### Testing the Effect of Information Display on HH Behavior

- Hard to find real-life investment environment where the manner in which information is displayed changed while the attainable information set remained constant
  - $\rightarrow\,$  Difficult to disentangle the effect of the display of information from the effect of changes to the attainable information set

### Testing the Effect of Information Display on HH Behavior

- Hard to find real-life investment environment where the manner in which information is displayed changed while the attainable information set remained constant
  - $\rightarrow\,$  Difficult to disentangle the effect of the display of information from the effect of changes to the attainable information set
- Even if such a setting is found, unobserved time trends could drive any observable effect

### What I Do

- I exploit an Israeli regulatory reform: where retirement funds were subject to changes in the manner in which they could display their past performance:
  - Before: prominently displayed 1-month returns
  - After: can only display 12-month+ returns

→ Attainable information set remains the same:  $r_{t-1} = \frac{r_{[t-13,t-1]}+1}{r_{[t-13,t-2]}+1} - 1$ > calculation

I estimate a differences-in-differences specification: using funds not subject to the regulation to control for possible unobserved factors

### BEFORE Regulation: past 1-month return

Maya Shaton

Information Display and Household Behavior

### Preview of Results

- In Fund flows are less sensitive to past returns
- 2 Reduced trade volume
- O Allocation to riskier retirement funds

### Background: Dataset

- Dataset
  - Fund level data for universe of retirement and mutual funds
  - Sample period: 48 months
- Retirement funds
  - Allowances and Compensation Provident Funds
  - Similar to 401K mutual funds in the US
  - Tax efficient
    - Tax exemption up to certain level if redeemed at retirement
    - $\bullet\,$  Generally, 35% tax penalty incurred if redeemed early
  - Regulated by the Israeli Minister of Finance (MOF)
- Mutual Funds
  - Open-ended mutual funds
  - Similar investment-vehicle to mutual funds in the US
  - Tax treatment:
    - Most funds are not taxed at the fund level
    - Capital gains tax when units are redeemed
  - Regulated by the Israeli Securities Authority (ISA)

Maya Shaton

Information Display and Household Behavior

## Background: Regulation

- Regulatory change:
  - March 2009: The MOF proposes the new regulation
  - Dec 2009: The MOF prohibits the display of returns for any period shorter than 12 months
  - Jan 2010: Deadline to implement the new regulation quote
- The regulation:
  - Only applies to retirement funds
  - Regulation applied to the official government website, retirement funds' websites, and any marketing material
  - Households could still extract the 1-month return from the attainable information set <a>calculation</a>

### Fund Flow Sensitivity to Past 1-Month Return

- Well-documented performance-flow relation proxy for HH behavior [*Sirri and Tufano, 1998; Frazzini and Lamont, 2008*]
- IF information display is not relevant  $\rightarrow$  I do not expect to find changes in HH behavior following the regulation

### Fund Flow Sensitivity to Past 1-Month Return

- Well-documented performance-flow relation proxy for HH behavior [*Sirri and Tufano, 1998; Frazzini and Lamont, 2008*]
- IF information display is not relevant  $\rightarrow$  I do not expect to find changes in HH behavior following the regulation
- To test this hypothesis I estimate the following specification:

$$FF_{i,t} = \beta_1(r_{i,t-1}) + \beta_2(r_{i,t-1} \times Post_t) + \beta_3(r_{i,t-1} \times RF_i) + \beta_4(r_{i,t-1} \times Post_t \times RF_i) + \beta_5(Post_t \times RF_i) + Controls + \gamma_t + \alpha_i + \varepsilon_{i,t}$$

- The main coefficient of interest is  $\beta_4$ 
  - Identifies any impact of the regulation on HH behavior

### Fund Flow Sensitivity to Past 1-Month Return

Maya Shaton

### Fund Flow Sensitivity to Past 1-Month Return

	FF <sub>i,t</sub>	FF <sub>i,t</sub>
-	(1)	(2)
$Post_t \times RF_i$	-0.774	-0.774
	[-0.76]	[-0.60]

	[-4.45]	[-3.40]
Yr-Mth FE	Х	Х
Fund FE	Х	Х
Cluster	Fund	Fund, Yr-Mth
Ν	73074	73074

### Fund Flow Sensitivity to Past 1-Month Return

- Fund flows were sensitive to past performance prior to the regulation
- $\beta_4 < 0$ : Fund flow sensitivity to past 1-month return decreases significantly following the regulation
- Robust to using different definitions for net fund flow 🕑
- $\Rightarrow\,$  These results suggest that HH are influenced by information salience

### Trade Volume

- The change in the display of returns may impact trading volume
  - $\rightarrow\,$  Once 1-month returns are not as salient, HH possibly trade less in these funds

### Trade Volume

- The change in the display of returns may impact trading volume  $\rightarrow$  Once 1-month returns are not as salient, HH possibly trade less in these funds
- To test this hypothesis I estimate the following specification:

$$\mathsf{log}(\mathsf{TradeS}_{i,t}) = \alpha_i + \gamma_t + \beta_1(\mathsf{Post}_t \times \mathsf{RF}_i) + \mathsf{R}_{i,t-1} + \varepsilon_{it}$$

- *TradeS<sub>i,t</sub>* = absolute sum of funds actively initiated by HH scaled by fund's size
- The coefficient of interest is  $\beta_1$ 
  - Captures the effect of the change in information display on retirement funds' trade volume

### Trade Volume

	(1)	(2)
	$TradeS_{i,t}$	$\log TradeS_{i,t}$
$Post_t \times RF_i$	-2.884*** (-4.69)	-0.383*** (-6.51)
$r_{i,t-1}$	0.306*** (9.42)	0.0165*** (11.18)
$\boldsymbol{\tau}_{i,[t-12,t-1]}$	0.196*** (15.53)	0.0125*** (20.24)
Controls	Х	Х
Ν	65674	63880

- I find that  $\beta_1 < 0$
- Effect is economically significant
  - $\rightarrow\,$  Retirement funds' trade volume decreased by  $\approx 35\%$  compared to the control group  $\bigcirc$

Maya Shaton

### Parallel Trends Trade Volume

Maya Shaton

Information Display and Household Behavior

### **Risk Allocation**

• How does information display affect risk allocation?

- Generally 12-month returns are smoother than 1-month return
  - $\rightarrow\,$  Possibly could impact HH perception of losses
  - $\rightarrow\,$  Ultimately the way HH perceive retirement funds' risk profile
- Consistent with HH exhibiting myopic loss aversion [Benartzi and Thaler, 1995] MLA ROBALA

### Myopic Loss Aversion

- Myopic loss aversion (Benartzi and Thaler, 1995)
- Individuals often reject a gamble of (200, 0.5; -100, 0.5), but will accept 100 repetitions of this if they are not forced to view outcomes sequentially

#### ▶ RobMLA

### **Risk Allocation**

• To test whether HH changed their risk allocation I estimate:

$$\begin{aligned} \text{Log}(\text{In/Outflow}_{i,t}) &= \beta_1(\text{RiskMeasure}_i \times \text{Post}_t) \\ &+ \beta_2(\text{RiskMeasure}_i \times \text{RF}_i) \\ &+ \beta_3(\text{RiskMeasure}_i \times \text{Post}_t \times \text{RF}_i) \\ &+ \beta_4(\text{Post}_t \times \text{RF}_i) + \gamma_t + \alpha_i + R_{i,t-1} + \varepsilon_{i,t} \end{aligned}$$

- The main coefficient of interest in this specification is  $\beta_3$ 
  - Represents the impact of the regulation on HH's flow allocation to riskier retirement funds
- 2 alternative risk measures:
  - Equity<sub>i</sub>: fund average equity exposure prior to the new regulation
  - Volatility<sub>i</sub>: fund average volatility prior to the new regulation

### Risk Allocation - Inflows/Ouflows

	LogIN <sub>it</sub>	LogOUT <sub>it</sub>
	(1)	(2)
$Post_t \times RF_i$	-0.786***	-0.0194
	[-4.79]	[-0.18]
$Post_t \times Volatility_i$	-0.0517***	0.0468***
	[-3.78]	[4.57]
$Post_t \times Volatility \times RF_i$	0.152***	-0.0748*
	[2.65]	[-1.86]
$R_{it-1}$	Х	Х
Yr – Mth FE	Х	Х
Fund FE	Х	Х
Ν	48483	48483

• Similar results for inflows/outflows into equity funds

Maya Shaton

Information Display and Household Behavior

### **Risk Allocation**

- I find that inflows into riskier funds significantly increased following the regulation
  - I also find that net fund flow significantly increased following the regulation
- This effect is economically significant
  - 1 std increase in the risk measure is associated with a 20% monthly increase in inflows on average
  - Could have important implication for total accumulated wealth at retirement
    - $\rightarrow\,$  Back of the envelope calculation:  $\approx 15\%$  increase of wealth at retirement  $\bigodot$  Example
- These results are consistent with HH exhibiting myopic loss aversion

### Fund Flow Sensitivity to Past 12-Month Return

- The results presented so far suggest that HH are influenced by information display
- $\Rightarrow$  But how do HH react to past 12-month returns following the regulation? is NOT OBVIOUS
  - <u>Relative Salience</u>: Post regulation 12-month returns are the default performance measure, hence these are more prominent and would attract more attention.

 $\rightarrow$  HH would rely more on 12-month returns post regulation ( $H_1$ )

- <u>Absolute Salience</u>: 12-month returns are smoother and less exciting than 1-month returns. Therefore 12-month returns would attract less attention than the "glittery" 1-month returns.
  - $\rightarrow$  HH would rely less on past 12-month returns post regulation (H<sub>2</sub>)

### Fund Flow Sensitivity to Past 12-Month Return

• To test these alternative hypotheses I estimate the following specification:

$$FF_{i,t} = \beta_1(r_{i,t-1}) + \beta_2(r_{i,t-1} \times Post_t) + \beta_3(r_{i,t-1} \times RF_i) + \beta_4(r_{i,t-1} \times Post_t \times RF_i) + \beta_5(r_{i,[t-12,t-1]}) + \beta_6(r_{i,[t-12,t-1]} \times Post_t) + \beta_7(r_{i,[t-12,t-1]} \times RF_i) + \beta_8(r_{i,[t-12,t-1]} \times Post_t \times RF_i) + \beta_9(Post_t \times RF_i) + Controls + \gamma_t + \alpha_i + \varepsilon_{i,t}$$

- The main coefficients of interest are  $\beta_4$  and  $\beta_8$ 
  - In line with  $H_1$ :  $\beta_4 < 0$  and  $\beta_8 > 0$
  - In line with  $H_2$ :  $\beta_4 < 0$  and  $\beta_8 < 0$

### Fund Flow Sensitivity to Past 12-Month Return

	$FF_{i,t}$	$FF_{i,t}$

Maya Shaton

Information Display and Household Behavior

### Fund Flow Sensitivity to Past 12-Month Return

- I find that  $\beta_4 < 0$  and  $\beta_8 < 0$ :
  - Fund flow sensitivity to past 1-month and 12-month returns significantly decreases following the regulation
  - Consistent with Global Hypothesis/Absolute Salience
  - Suggests HH could be paying less attention to their retirement funds following the regulation

### Fund Flow Sensitivity to Past 12-Month Return

• I find that  $\beta_4 < 0$  and  $\beta_8 < 0$ :

- Fund flow sensitivity to past 1-month and 12-month returns significantly decreases following the regulation
- Consistent with Global Hypothesis/Absolute Salience
- Suggests HH could be paying less attention to their retirement funds following the regulation
- Alternative explanation Info Acquisition Transaction Cost
  - Potentially consistent with  $\beta_4 < 0$
  - BUT inconsistent with  $\beta_8 < 0$ 
    - $\rightarrow~$  12-month return are less costly to obtain following the regulation
    - $\rightarrow\,$  Result inconsistent with a pure information cost acquisition explanation

### Public Policy Implications

These results could have important public policy implications:

- **1** Relatively low-cost regulation with a potential strong impact on HH
  - Accumulated wealth at retirement
  - *IF* one accepts that investors trade excessively, or under/over invest in equities  $\rightarrow$  could have significant welfare implication
- On the attainable information set thus could be regarded as less paternalistic and encounter less resistant
- By disregarding the effect information display has on investors, regulators may be granting power to disclosing entities unintentionally
  - Especially relevant in markets where sophisticated players are displaying information to unsophisticated investors

### Conclusion

- I use a regulatory change to examine *whether* and *how* the manner in which information is displayed influences HH's investment behavior
- I find that following the regulation:
  - Fund flows are less sensitive to past returns
    - $\rightarrow\,$  Consistent with information salience been an important driver of HH investment behavior
  - Trade volume significantly decreases
    - $\rightarrow\,$  Effect is economically significant: decrease of  $\approx 35\%$
  - HH allocate more of their retirement savings into riskier funds
    - $\rightarrow~$  Could influence HH's accumulated wealth at retirement
    - $\rightarrow~$  Consistent with HH exhibiting myopic loss aversion
- Potential important public policy implications

# Thank you!

# APPENDIX

### Example How to Compute the 1-Month Return

- r<sub>t</sub> the monthly return in month t
- $r_{t-13,t-1}$  the 13-month return from period t-13 to t-1
- $r_{t-13,t-2}$  the 12-month return from period t-13 to t-2
- Then an investor can extract  $r_{t-1} = rac{r_{[t-13,t-1]}+1}{r_{[t-13,t-2]}+1} 1$

Screenshot Website

Regulation

▶ What I Do

### Regulation

The MOF in 2009:

"Pension savings products are long term savings products whose performance should be examined over long periods. The rules for publication of the funds yields are intended to enable the saver to make a comparison between the various pension savings products and to assist that saver in reaching an informed decision regarding their investment..... Since, as stated, these are long term savings, we will prohibit the institutional bodies from displaying short-term performance....."

## Time Varying Sensitivity

- Markets rose dramatically around the passage of the regulation
- TA 100:

▶ result1

#### Appendix

Why Did FF sensitivity to Past 1-month Returns Increase for the Control Group?

- Ostrich Effect (Karlsson, Loewenstein and Seppi, 2009): Investors monitor and respond more to information regarding their investments when markets are rising
  - Sicherman et al.(2012): Logins into retirement accounts fall by 9.5% after market declines
  - Glode et al.(2012): Performance predictability in mutual funds increases after periods of high markets returns but not after periods of low markets returns [cross sectional]
  - Xie (2011): Mutual funds' investors' sensitivity to fund performance increases when stock markets returns are high [time series]
  - Ben-Rephael, Kandel and Wohl (2011): Israeli mutual funds behave similarly to their US counterparts (similar evidence from Ferreira et al., 2012)

▶ result1
